

01 · THE PROBLEM

To ship one on-chain agent, a team builds **all of this**.

WITHOUT AOMI · YOU BUILD

Surfaces web widget · telegram · discord	+2 mo	Solana path separate stack · jito bundles	+1.5 mo
AA bundler + paymaster etc-4337 · userOps · sponsorship	+1.5 mo	Simulation infra THE MOAT full nodes · 6 chains · fresh forks	+3 mo
TX pipeline nonce · gas · retries · batching	+2 mo	Agent orchestration llm loop · streaming · sessions · fallover	+3 mo
VS			

WITH AOMI

aomi

HOSTED RUNTIME

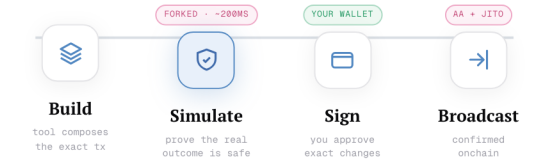

9-months \$100k+/yr infra

3 days \$0

wrap your API as tools — runtime · forks · AA bundler · Jito already built · 0 keys held

≈ 4 crypto engineers · 9 months · ~\$1M before the first user signs — then **\$100k+/yr infra** + 1 FTE chasing hardforks & RPC churn, forever.

Every transaction simulated against **live forked state**.

Read & write chain + wallet state in a simulated fork.

I'll activate the Uniswap skill and build the swap 1 ETH → USDC.

● Check network Ethereum

#25,585,992

⚡ Simulate swap · Uniswap V3

✖ Failed

⚡ Simulate swap · Uniswap V3

✔ Passed

0xa73f...74f5 0x68b3...fc45

ETH Base OP

uniswap pool · 1 ETH = 2k USDC

WALLET: 5.1 ETH · 100 USDC SOLANA 50 SOL

1k ETH = 2M USDC in the OP pool → swap(2k USDC → 1 ETH) per user intent, then unwrap(1 ETH) via WETH.

You approve the exact diff — then it broadcasts, keys in hand.

EXACT NET CHANGES your wallet

weETH - 2,400 morpho position + 2,400 gas sponsored · paymaster

⚡ Approve & Sign

keys never leave your device

BROADCAST · AA + JITO Success

tx 0x9f2c...ab13 block #25,585,994 batched 2 actions → 1 sig

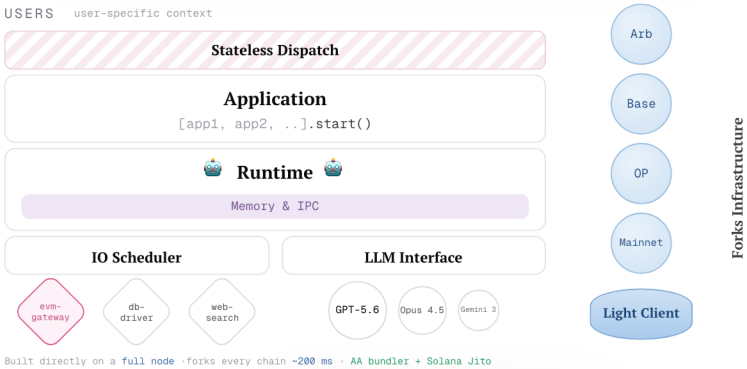

confirmed onchain · same rails settle app fees

aomi labs

The native harness on blockchains.

One harness. Many apps. Every chain.

Built directly on a **full node** · forks every chain ~200 ms · AA bundler + Solana Jito

CASE STUDY · SOMM FINANCE

```
GET /idle_assets
GET /risk_snapshot
POST /assess-position →
GET /credit-balance
POST /propose-intent
```

The builder statement

Everything above bills the **user**. Separately, Aomi bills the **builder** through a derived ledger — `statement_entries` — priced by four take rates committed in `rates.toml`; the parsed struct *is* the biller, pinned by a unit test so it never reprices silently.

10%

Tool take

Take on the gross of a builder's paid tool call (x402) · 10% of the call.

10%

Managed-model markup

Markup on base model cost for managed-key apps; BYOK pays 0, no line written.

30%

Outcome take

Take on a builder's outcome fee — the on-chain bps-of-flow · 30% of the fee.

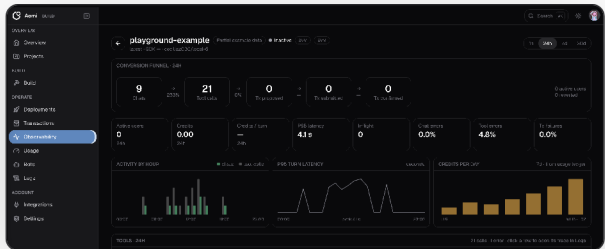

\$10/mo

Hosting

Flat per app per calendar month; the whole charge is the platform's fee.

03 · THE PROOF

TRACTION TODAY · OBSERVED

Per-app funnel · P95 latency · credits/turn · tool error rates — the same telemetry we bill from.

Distribution is real. *Now scale the network.*

33 apps loaded in production, 1734 accounts have entered a product thread, and 662 transaction-simulation steps are recorded. The five-year scale case follows active accounts, production apps, and modeled monthly transaction volume.

PLATFORM REVENUE MODEL		At 10,000 hosted apps · illustrative
REVENUE ENGINE	CALCULATION	ANNUAL
Hosting	10,000 × \$10 × 12	\$1.20M
Managed-model margin	1.2M × 6 × 12 × \$0.05 × 10%	\$432K
Paid-tool take	\$24.0M × 10%	\$2.40M
Outcome take	\$1.20M × 10 bps × 30%	\$360K
Total annualized platform revenue		\$4.39M

GROWTH IS OPTIONALITY One engine · three GTM scenarios
The same billing engine above scales differently by sector. The revenue mix rotates with who the buyer is — retail flow, managed AUM, or the long tail of hosted apps.

Wallet & retail fintech

\$35.6M

Y5 SOM · OUTCOME-LED

\$2.5B TAM · \$300M SAM · 18% SOM.
Huge retail flow; BYOK keeps model margin thin.

Digital-asset management

\$51.4M

Y5 SOM · OUTCOME-LED

\$3.5B TAM · \$300M SAM · 18% SOM.
Few users, enormous AUM; rich managed fees.

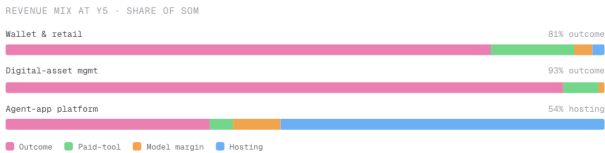

Agent-app platform

\$17.8M

Y5 SOM · HOSTING-LED

\$1.0B TAM · \$150M SAM · 12% SOM.
Tens of thousands of apps on managed model.

5-YEAR RAMP TO SOM · \$M

Ramp bars share one \$M axis (max \$51.4M). Y1 target = \$806.4k/mo. Five-year paths are illustrative planning assumptions; the engine rotates with the GTM sector.
